

Plum Claims Evaluation Report

Google Docs ready formatted version of the policy pipeline evaluation

Prepared from generated evaluation artifacts on 2026-09-27.

Executive Result

Conclusion: 12 of 12 supplied structured fixture cases matched the expected decision, amount, reason, confidence rule, and explicit behavior checks.

Scope: This evaluation proves deterministic policy pipeline behavior against structured fixtures. It does not prove OCR accuracy, handwriting support, multilingual extraction, image quality handling, or calibrated confidence.

Interpretation and Limits

- The engine reads only the canonical policy produced from the unmodified policy file; every interpretation, merge, and conflict resolution is captured in the canonical audit trail and referenced from decision traces.
- The per-claim ceiling is the maximum of the global per-claim limit and the relevant category sub-limit, tested on eligible amount after excluded lines are removed. A matched pre-authorization rule governs amounts above the ceiling instead.
- Category sub-limits are annual per-member caps on net benefit for the category's own service lines. For consultation, tests and medicines billed with a consultation are not treated as consultation service lines.
- Aggregate limits are applied when utilisation accompanies the claim. If utilisation is absent, those rules are recorded as not evaluated, disclosed as advisory reasons on payable outcomes, and reflected in confidence.
- The supplied cases do not carry a submission date, so the 30-day submission deadline is not evaluated for them. Web intake stamps a server-side submission date at intake.
- Confidence values are heuristic evidence-completeness scores, not calibrated probabilities. TC011 intentionally simulates optional risk enrichment failure and records the degraded confidence and review recommendation.
